

THE GRAND CANYON

Not every couple dreams of a beach honeymoon. Nature lovers may prefer a more active holiday and to be awed by the great outdoors, and what better place to take your breath away, than Arizona's Grand Canyon?

At over 1.6 kilometres deep and in places up to 32 kilometres wide, the scale of the Grand Canyon is hard to comprehend. That first view of the Grand Canyon will live on in your memory always, as it lives up to its name, with layer upon layer of craggy sandstone and volcanic formations and of course the cause of it all, the Colorado River, winding its way through 445 kilometres of the canyon floor. It is truly one of earth's greatest landmarks.

When you stand on the canyon rim you cannot help but feel humbled by nature. The canyon is said to have taken over 40 million years to develop, and at first glance it looks uninhabitable, but on closer inspection you'll begin to notice trees, plant life, birds, maybe a mammal (if you're lucky), or even a reptile (if you're not quite so lucky)!
